

- A clear README explaining how to run the project, and the reasons behind the technical decisions you made

Bonus points for

- The ability to add more appointment slots
- Thinking about security and authentication
- Thinking about observability and monitoring

Once you're done

Create a repo on GitHub for your code - don't worry about hosting it or anything.

Please don't name it after Spill, or preferably make it private so future applicants can't find your solution. You can share private repos with [Spill-engineering](#).

Let us know when you're done!
